

**METHOD FOR CALLING UP USER-SPECIFIED INFORMATION
USING A MOBILE TELEPHONE**

09/176012

ABSTRACT

The SMS messages of a mobile telephone are used to call up information which is
unconnected in time and location with the mobile telephone. To specify the desired
information and to define the brief commands the user of the mobile telephone uses
data-processing equipment with data lines to the information provider, e.g. Internet
connection, by means of which he can deposit query profiles with the information
provider. In addition, the query profiles can be produced using a speech computer.
The user can call up the dormant query profiles by means of simple brief commands
and obtain the required information. The desired information will be reproduced either
visually or acoustically via the mobile telephone. The advantages of both
communication media are therefore combined with one another in an ideal manner,
where the hardware of the mobile telephone and/or its method of operation remain
unchanged.
